

The Coordinating Ministry of Maritime Affairs and Investment Republic of Indonesia

Breakout 4: Emission Trading Systems in the Asia-Pasific Region (Good Practices and Challenge for Indonesia)

ILHAM
Deputy Director of Carbon Utilization Affairs

The National Long-Term Development Plan (RPJPN) (Law No. 59 Year 2024)

National Long-Term Development Plan (RPJPN) is a solid foundation for Indonesia's national development over the next twenty years and a strategic step toward achieving the Golden Indonesia 2045 Vision

RPJPN will ensure the principles of development agenda implementation, guarantee planning and funding consistency, control and evaluation frameworks, incentive systems, modification mechanisms, and effective public communication.

Article 14

The 2025-2045 RPJPN must be a guideline for the preparation of master plans, national strategies, road maps, or other terms related to the elaboration of the field of long-term and medium-term National Development Planning

Top 5 economies in the world – GDP per capita of USD 30,300 from USD 5.500

Less inequality – reducing extreme poverty rate to 0% from 6.0-7.0%

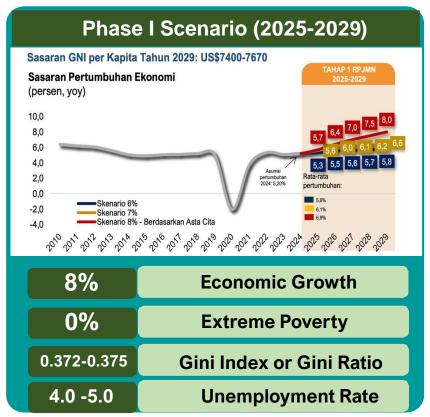

International influence – Globa Power Index to top 15 countries from 34th rank

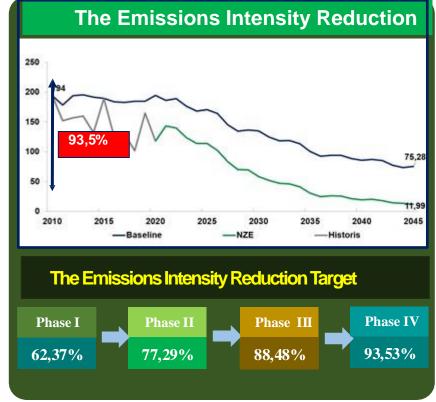

Future-ready workforce – Human Capital Index to 0.73 from 0.54

Net Zero Emission – lower greenhouse gas intensity to 93.5% from 38.6%

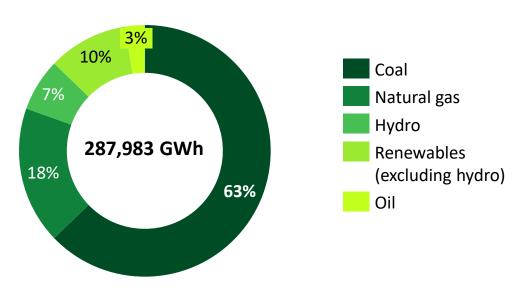

Indonesia must seek other alternatives to accelerate the realization of the country's significant potential for decarbonization

Current role of coal in the energy mix

Indonesia's electricity generation by source (2020)

- **Coal power plants comprised 63%** of Indonesia's electricity generation in 2020.
- In 2022, the total capacity of coal fired power plants (CFPP) amounted to 40 GW.

Potential for decarbonization

World's largest **nickel (2.8 Bn tons)** deposits

94 million hectares of forests (50% of total land)

3000+ GW of **solar energy** potential

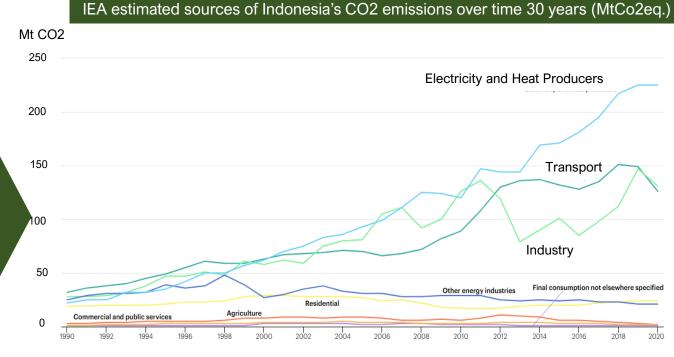

75 GW of **hydro energy** potential

Decarbonization Strategy Through by the Carbon Pricing Roadmap

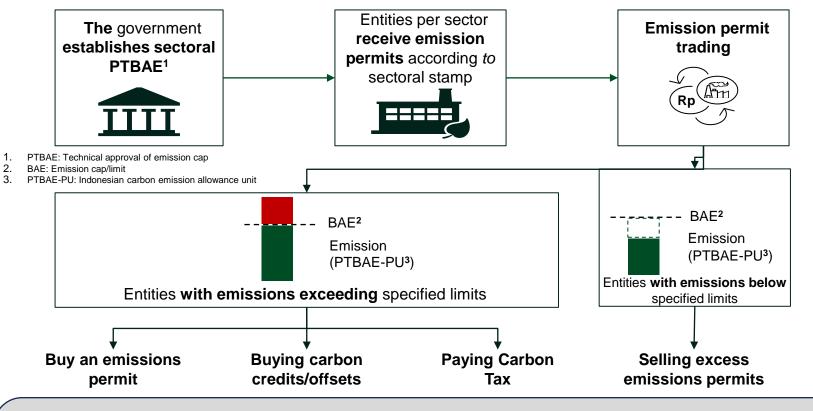

IEA. All rights reserved

In these emissions estimates, transport and industry sectors show high contributions to overall emissions and both of them, will be a priority for next carbon pricing road map

Electricity and heat producers
 Other energy industries
 Industry
 Transport
 Residential
 Commercial and public services
 Agriculture
 Final consumption not elsewhere specified

ETS is used by Indonesia to ensure sectoral emissions and pathway to achieve Net Zero Emission (Decarbonizations)

Regulatory framework

Law No. 7/2021 on Harmonization of Taxation Regulation

Law No. 4/2023 on Development and Strengthening the Financial Sector

Presidential Regulation 98/2021 on overall framework for economic value of carbon in Indonesia

MoEF Regulation No. 21/2022 on overall carbon market implementation guideline (including carbon units issuance and allocation process)

MEMR Regulation No. 16/2022 on Power Sector Carbon ETS Implementation Procedures

MoEF Regulation No. 7/2023 on FOLU Sector Carbon ETS Implementation Procedures

OJK Regulation 14/2023 on carbon trading via the carbon exchange

Cross-sectoral trade

Current carbon units

FOLU (Ministry of Environment & Forestry)

Waste (Ministry of Environment & Forestry)

Energy (Ministry of Energy & Mineral Resource)

Industry
(Ministry of Industry)

Agriculture

(Ministry of Agriculture)

PTBAE-PU

- VCM is not well accepted within government yet, government prioritizes the use of domestic mechanism
- There is initiative to develop CO2 avoidance credits from CFPP early retirement and CCS

The Overview of Indonesian ETS

- 1 CAP SETTING
 - ✓ Intensity-Based
- 2 FREE ALLOCATION METHODS

✓ Benchmark (Weighting Average)

3 MARKET UPDATE

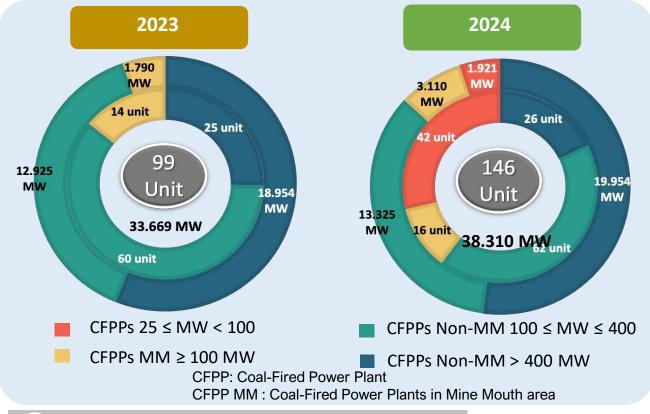

It has started direct trading among the coal-fired power plant. Soon, it will also be transacted through the carbon exchange

Source: Ministry of Energy and Mineral Resources

- Coal-Fired Power Plant
- ✓ Beyond 25 MW

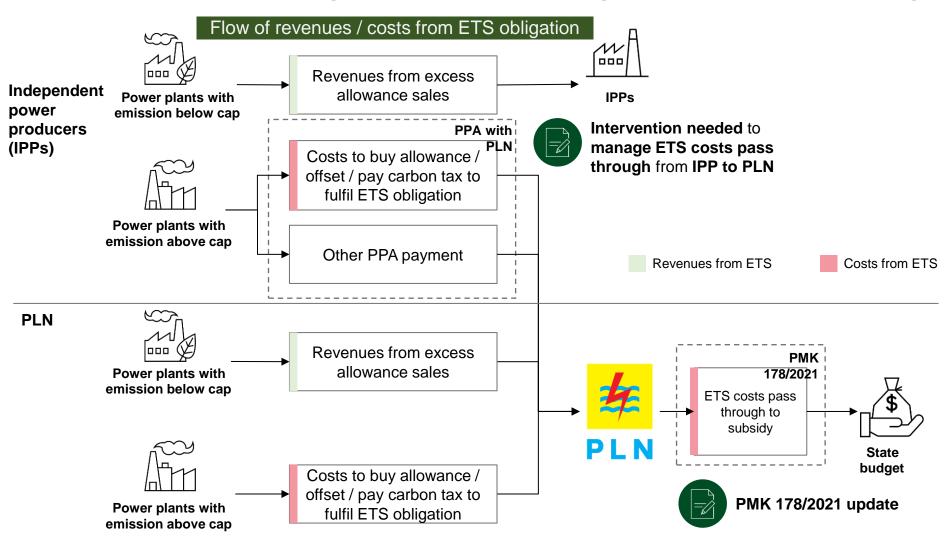

5 AUCTION AND BOROWWING-BANKING

Indonesian ETS has not yet implemented the auction and borrowing-banking system (moving forward to implement auction and borrow-banking mechanism)

Current Situation of Indonesian ETS

Intervention needed to manage ETS costs pass through to PLN and the state budget

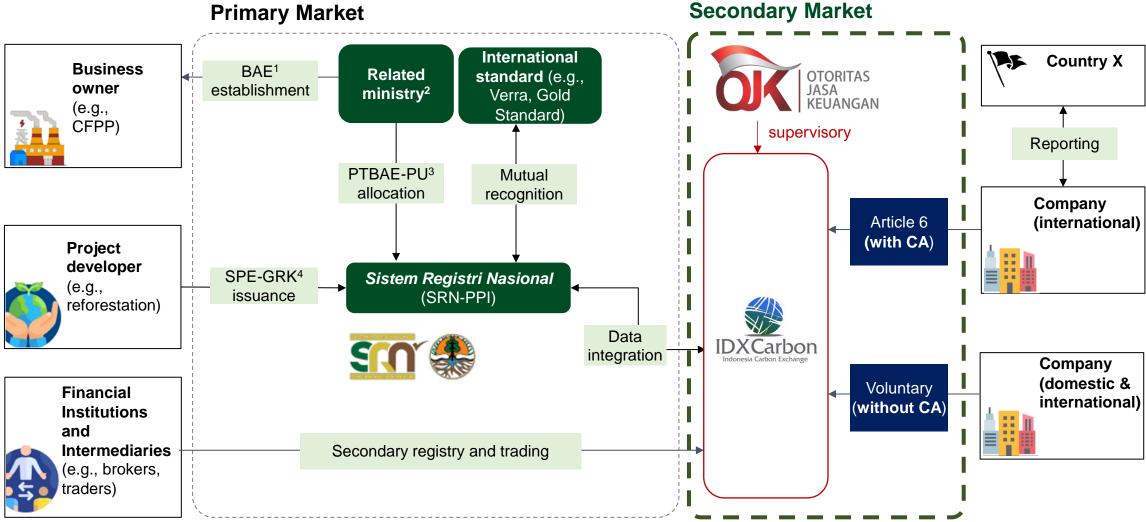

ETS cost pass through to subsidy can be regulated by updating the PMK 178/2021

However, intervention needed in the mechanism / requirement under PLN's electricity payment to IPP to manage the ETS costs pass through to PLN; potential solutions:

- PPA renegotiation oneby-one
- Minimum specific fuel consumption (SFC) requirement to IPPs, audited by the government ☐ need to change PTBAE-PU allocation method under Permen ESDM 16/2022
- Other for discussion

Indonesia Carbon Trading Ecosystem Currently

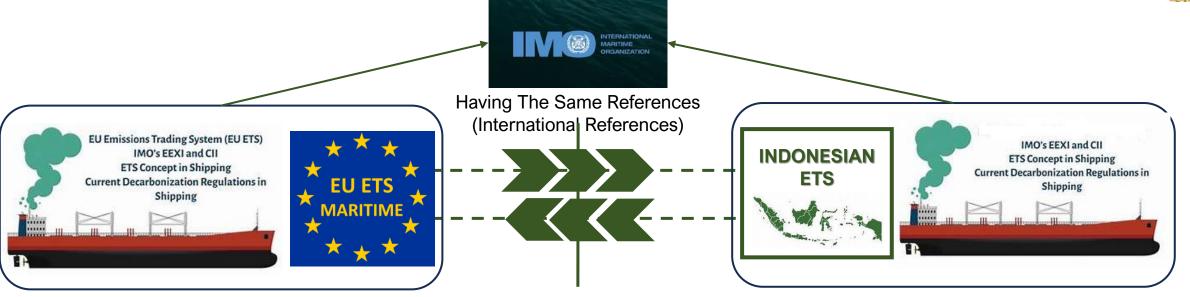

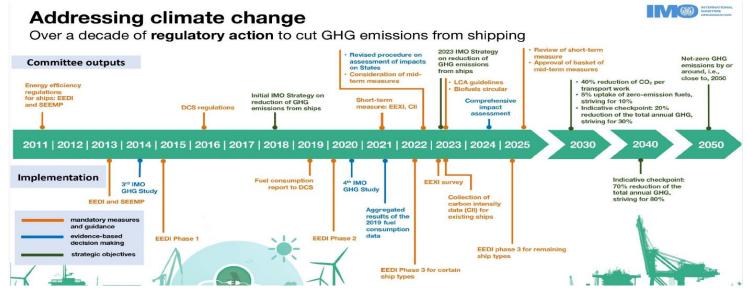

- BAE: Emission cap/limit
- . The technical ministry (e.g., Ministry of Energy and Mineral Resources, Ministry of Environment and Forestry)
- PTBAE-PU: Indonesian carbon emission allowance unit
- 4. SPE-GRK: Indonesia carbon credit/emission reduction certificate

Potential of International ETS Linking in Shipping Maritime Sector

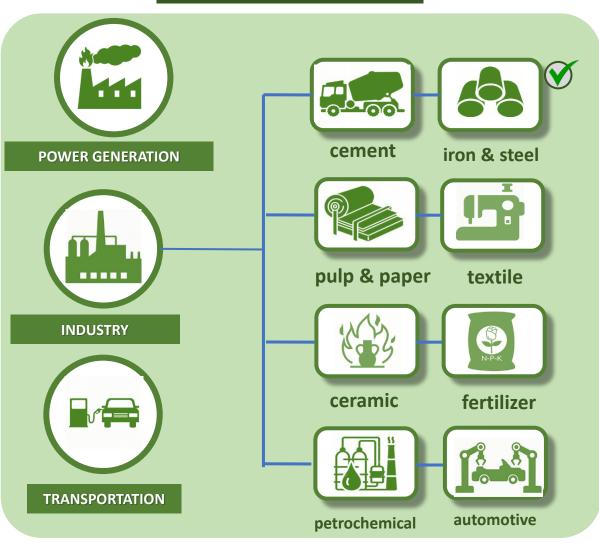

Moving Forward the Indonesian ETS and Its Development

NEXT CARBON PRICING

CARBON PRICING ROADMAP (SHORT TERM AND LONGTERM)

- **Aligned roadmap to achieve NDC targets**
- Proper selection and designing of carbon pricing instrument to avoid double charging (e.g., expanding ETS to industrial and oil & gas sector)
- Building better data management system (incl. digitalization and technology) to enhance transparency and integrity
- Supporting the creation of one market and one price for all regulated sectors/subsectors ETS and cross learning opportunity between sectors
- Involvement of all related stakeholders (including enterprises, associations, and communities)
- Study on the Potential International ETS Linking in Shipping Maritime and Aviation
- Best Practices of Implementation on International ETS Linking in Shipping Maritime and Aviation

THANK YOU

GREEN INVESTMENT

The Benefit of ETS Implementation

BEFORE

- The quantity of CFPPs which has the emission level (Intensity) of Coal-Fired Power Plants as beyond 1.0 tonCO2/MWh, is 95
 CFPPs
- The maximum intensity is almost reach 4.0 tonCO2/MWh

- ☐ From 116 installation unit of CFPPs, the number of CFPP which has emission intensity above to 1.0 ton CO2/MWh = 95 Coal-Fired Power Plants
- ☐ From 116 installation unit of CFPPs, the number of CFPP which has emission intensity above to .1.5 ton CO2/MWh = 52 Coal-Fired Power Plants
- ☐ From 116 installation unit of CFPPs, the number of CFPP which has emission intensity aboveto 2.0 ton CO2/MWh = 20 Coal-Fired Power Plants

AFTER

The quantity of CFPPs which has the emission level (Intensity) of Coal-Fired Power Plants as beyond 1.0 tonCO2/MWh, is 32 CFPPs

Total Surplus dan Defisit Grup Perusahaan (tCO2

■ The maximum intensity is 1.5 tonCO2/MWh

EU Emissions Trading Scheme's extension to maritime transport

It is crucial to highlight that the extension of the EU ETS to the shipping industry has not been without significant challenges, some of which remain outstanding

Monitoring, Reporting and Verification – the basis for any Emissions Trading Scheme

To facilitate an MRV system, a digital reporting system for users to input data is vital. It is also vital that any MRV system is also aligned with the International Maritime Organization's (IMO) Data Collection System (DCS. It is essential that there is alignment with respect to:

- The metrics used;
- The format of collating and submitting;
- Definitions and the data being requested;
- Submission deadlines and periodic compliance cycles;
- Data integrity and quality with involvement of accredited verifiers

No Double Payment

As a general principle, ship operators should not be expected to pay multiple times for the same emissions which would only add to regulatory uncertainty and create market distortion.

This basket of mid-term measures is still to be finalized and IMO scheme should have primacy. So as to avoid multiple payments being made for the same emissions under multiple regimes, it is recommended that:

- The definition of domestic maritime voyages and emissions within scope of a domestic ETS be made as clear as possible;
- The definition should be drafted so as to avoid overlap with emissions already accounted for on a regional and international basis;
- IMO scheme should have primacy in order to avoid any double payment and if regional schemes exist there should be clear mechanism to avoid paying twice for the same emissions

Avoid as far as possible Double Reporting

The government should also seek to avoid the duplication of reporting already undertaken on a regional and international level.

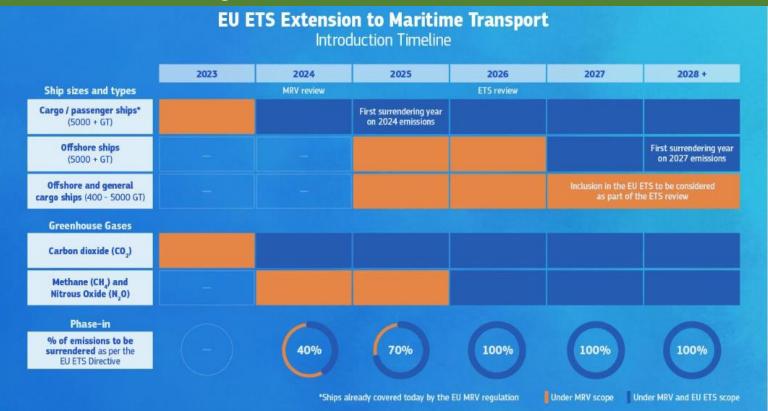

Potential of International ETS Linking in Shipping Maritime Sector (1)

Registration of Foreign Entity

Foreign non-EU based shipping companies have experienced multiple challenges. These include difficulties with registering with certain Administering Authorities and opening a Maritime Operator Holding Account (MOHA) for the purposes of purchasing, trading and surrendering EU allowances to cover relevant emissions

EU Emissions Trading Scheme – Maritime Timeline

Note the possibility of the EU amending its ETS if sufficient progress is made at IMO
